- SDS memory

Selling Features

- power-over-ethernet (Hardware)
- magnetic fixation for handset (Hardware)

Accessories

- headset adapter (for telephone switching)
- PTT foot switch
- power-supply unit
- headset

Third Party Interfaces

In addition to the Major BOS 4VDs, further audio and / or data applications can be used with the same radios via the FT638 digital radio box. These can be connected physically via designed connectors or via ethernet.

The integration of additional data applications can be achieved with a minimum effort due to our PEI-AT-multiplexer (embedded in FT638).

FT636B can also be used by third party applications for radio control as well as for signal decoding (e.g. fsk, tone sequences).

Depending on the type of the connection, additional selling features might be necessary. More information are available in the manuals of FT638 and FT636B.
